MEDICAL BIOPHYSICS COURSE MODULES
2021 – 2022
Special Message from the Department
Ontario’s response to the COVID-19 pandemic continues to evolve. Changes will likely occur as the province and its municipalities adjust to new data about the virus. In these circumstances, please be advised that the manner of delivery of courses, co-curricular opportunities, programs, and services is subject to change, in accordance with university policies. The University thanks its students, faculty, and staff for their flexibility during these challenging times as we work together to maintain the standards of excellence that are the hallmark of the University.
Course module enrolment

To enroll, course modules must be requested by students on ACORN/ROSI. Instructions are available at https://medbio.utoronto.ca/course-registration. Students can only add a course module if no more than 15% of the course has been completed. Students who do not register (pay or defer fees) by the deadline will be removed from their course registration. Courses such as RST9999Y and the seminar course, MBP1015Y are preloaded and requests are not necessary. Students should check ACORN/ROSI to make sure they are enrolled in these two courses.

- If students encounter difficulty when enrolling in their courses, they should contact either Donna (uptown students) or Annette (downtown students).

Course module availability

All biology stream modules will be offered in alternate years. A core set of physics stream modules is offered every year while more specialized topics will be offered in alternate years or based on student and faculty response to the new curriculum. Course modules schedules can be reviewed on the MBP calendar at https://medbio.utoronto.ca/mbp-calendar.

Withdrawing from a course module

Students can withdraw from a course module up until the end of the 3rd class or as long as no more than 50% of the module has been completed. While many instructors and programs consider it best practice to provide students with an interim evaluation of their performance in the course prior to the drop date, this is not a requirement for graduate courses (as per the University Assessment and Grading Practices Policy 2012). To request withdrawal from a module, please email the Coordinator of the module and cc Chau Dang and withdraw in ACORN. If students are unable to withdraw in ACORN, they must complete the Drop Course form and email it to Chau Dang.

Policy for students receiving a failing grade in a course module

In the case where a student receives a failing grade in a module (less than 70%), the failing grade will appear on the student’s transcript. If the module is one of the required modules MBP1200H or MBP1201H, the student will need to retake the module the following year. A passing grade is required for a module to count toward the graduation requirements.

Courses offered in other Departments

Graduate students at the University of Toronto can take graduate courses offered in any department, subject to availability and approval of their home department; the latter is given by the MBP graduate coordinators (Dr. Greg Stanisz or Dr. Lothar Lilge) on a case-by-case basis with approval of the student’s supervisor and the course coordinator. Please provide Annette (Downtown Students) or Donna (Uptown Students) with a copy of the required approvals. If the student misses the deadline for course registration online, they will need to fill out an Add/Drop Course form: https://www.sgs.utoronto.ca/wp-content/uploads/sites/253/2019/06/AddDropCourses.pdf
Some examples of courses that may be of interest to MBP graduate students are listed below.

1. IMM1431H – Immunotherapy
2. JNR1444Y – Fundamentals of Neuroscience: Cellular and Molecular
3. JEB1365H – Ultrasound: Theory and Applications in Biology and Medicine
4. BME1460H – Quantitative Fluorescence Microscopy: Theory and Application to Live Cell Imaging
5. JYG1555H – Advanced Topics: Cellular and Molecular Neurobiology
6. PSL1026H – Advanced Topics: Experimental Cell Physiology
7. CSC2515H – Introduction to Machine Learning
8. PSY5110H – Advanced Topics in Behavioural Neuroscience: Imaging Techniques in Preclinical Research
9. MSC1006H - Neuroanatomy – Introduction to Anatomical Organization of the Brain
10. PSY4706HS - Human Brain Anatomy
11. MSC1087H - Neuroimaging Methods using Magnetic Resonance Imaging
12. STA2005H - Applied multivariate analysis
13. STA4273H – Large Scale Machine Learning
14. MBP1023H - Clinical Radiation Physics and Dosimetry (to be confirmed for Winter 2022)
## COURSE MODULES
### Mandatory Modules

**MBP 1201H - Introductory Biostatistics**  
(0.25 credits)  
Sept. 14 – Nov. 2, with Python Bootcamp on Sept. 10

**MBP 1200H - Scientific Exposition and Ethics**  
(0.25 credits)  
Sept. 13 – Nov. 10

*Projected course offerings subject to change.
List of Course Modules 2021 - 2022

**Fall 2021**

- Biophysics of Focused Ultrasound, Thermal Biophysics
- Cancer Epigenetics
- Introductory Biostatistics - MANDATORY
- Magnetic Resonance Imaging – Overview
- Overview of Medical Imaging
- Radiation Biology and DNA Repair
- Scientific Exposition and Ethics - MANDATORY
- Quantitative Cancer Genomics
- Tumor Microenvironment

**Winter 2022**

- Advanced Ultrasound
- Basics of Cell and Molecular Biology
- Biomedical Applications of Artificial Intelligence
- Development, Stem Cells & Cancer
- Introduction to Bio-Microscopies
- Introduction to Biophotonics
- Medical Device Commercialization Essentials
- Medical Device Innovation and Entrepreneurship
- Radiation Oncology: Clinical & Experimental Radiobiology
- Ultrasound Overview

**NOTE:** Should there be insufficient enrolment in a module listed above, it will be offered the following year.

</tbody>
</table>

### Module Goals

Focused ultrasound can induce both thermal and non-thermal effects in biological tissues. These biophysical interactions form the basis of a range of therapeutic applications in current medical practice and in leading-edge research. The first half of this course will focus on thermal biophysics, drawing examples from focused ultrasound therapy as well as from other thermal modalities, such as radiofrequency and microwave. The physical and biophysical interaction mechanisms between the energy sources and tissue will be emphasized. Fundamentals of thermal dosimetry will be covered, with reference to the relevant tissue properties, the models of energy propagation within tissues, experimental techniques for dosimetry measurements, and the resulting biological effects. In the second half of this course nonthermal bioeffects of focused ultrasound will be examined. The physical mechanisms behind these mechanical effects will be covered, with an emphasis on cavitation and cavitation-mediated effects. Treatment monitoring considerations for non-thermal therapies will be discussed. The current status of thermal medicine and of focused ultrasound therapies will be reviewed using select clinical and pre-clinical examples.

### Evaluation Method

Exam (100%)

<tr>
<td>Recommended Prerequisites</td>
<td>NONE</td>
</tr>
<tr>
<td>Module Goals</td>
<td>Epigenetic regulation is critical in cancer development and progression. Moreover, epigenetic modifications can be used as therapeutic targets as well as biomarkers in cancer. This course will introduce basic concept in epigenetics and the frontiers in cancer epigenetics. Each class will consist of a one-hour student lecture reviewing the day’s topic, followed by a one-hour student-led interactive discussion around the specific papers.</td>
</tr>
<tr>
<td>Evaluation Method</td>
<td>Presentation and participation in discussion. Each student will be responsible for a lecture topic review to be held in the first hour (35% of their grade) and for a scientific manuscript presentation in the second hour (35% of their grade) of each lecture. All other students are expected to contribute to the scientific manuscript discussion in each lecture (30% of their grade). Lecturers will provide the lecture topic and suggest manuscripts to be discussed at least two weeks prior to the lecture date. The selected scientific manuscripts will need to be shared with all students at least one week before the lecture. Lecturers will be available in person or by email to provide an optional review of the students’ proposed presentation and discussion plan. The lecturers are responsible for assigning the student’s grade using an evaluation form common across all of the lectures.</td>

<td>None</td>
</tr>
</tbody>
</table>

**Module Goals**

DNA repair is critical for maintaining genomic integrity and its defects increase cancer risk. In addition, mutations in genes involved in DNA damage signaling or repair have also been associated with other human diseases and syndromes. DNA damage can also be induced to treat cancer patients as is the case for radiotherapy and a number of genotoxic anti-cancer drugs widely used in the clinics. This module will focus on DNA damage repair mechanisms and the physiological response to DNA insults, including radio- and chemo- therapies.

**Evaluation Method**

- Presentation/discussion of scientific papers assigned a week ahead of time by the lecturers.
- Class participation in all lectures.
- Students will be required to submit research proposals to address questions that have arisen out of the topics covered in the module. On Dec. 6, each student will be assigned by the coordinators a specific topic/lecture to cover with the research proposal.

Oral Presentation: 45%
Class Participation: 15%
Research Proposal: 40%

</tbody>
</table>

### Module Goals

Each class will consist of a 1-hour student lecture reviewing the day’s topic in detail, followed by interactive discussion around a specific paper, case report, or mini-workshop illustrating the application of research findings in a novel way (e.g. clinical application, meta-analysis, new use for old data). The organizing Instructor will provide a list of topics that must be covered by the student in the review portion of the class and moderate discussion during the more open portion.

### Evaluation Method

Each student will be responsible for a Lecture Topic Review to be held in the first hour (35% of their grade) and for a Scientific Manuscript Presentation in the second hour (35% of their grade) of each lecture. All other students are expected to contribute to the Scientific Manuscript Discussion in each lecture (30% of their grade). The class accepts a minimum of 6 and maximum of 14 students. Instructors are to provide the lecture topic and can suggest manuscripts to be discussed in the second hour at least one week prior to the start date. The selected Scientific Manuscript is to be shared with all students at least 3 days before the lecture (usually Monday the week of the class). Lecturers will be available in person or by email to provide an optional review of the student’s proposed presentation and discussion plan up to 3 days prior to student’s presentation. The Instructors are responsible for assigning the student’s grade using an evaluation form common across all of the lectures.

### Module Goals

The tumor microenvironment (TME) is a complex entity in human cancers. It is constituted by multiple structural and cellular aberrations that arise during tumorigenesis. How cellular and molecular features of TME underlie tumor development and progression, as well as how these characteristics form the basis for new biomarkers and cancer therapies will be covered in this topic.

The class will be split into groups of ~5 students. The instructor will deliver a lecture, followed by a presentation (30-40 minutes) delivered by a selected student group. The presentation will be based on 3-4 papers that have been provided at least two weeks ahead of the class. A set of instructions will also be provided to groups ahead of time. The non-presenting groups will actively participate in the review/criticism of these presented papers, as well as be prepared to cover the next set of questions in this field. Depending on the number of students enrolled, there will be either 1 or 2 rounds of presentations. Some lecturers will use a variation of the above format for class participation.

### Evaluation Method

Attendance/Participation/ Presentation (50%)
Exam (50%)

### Recommended Prerequisites

MBP1201H – Introductory Biostatistics or equivalent. Students should have a good working knowledge of probability, differential and integral calculus. The assignments will require programming in Python. A good understanding of the core syntax and principles of structured programming in Python or another programming language is required.

### Module Goals

This module is a graduate level course in machine learning and artificial intelligence applied to biomedical research. It covers core concepts, machine learning algorithms, and deep learning approaches. Applications in medical imaging, genomics and clinical information are discussed. Students will have an in-depth course project applying these techniques to real-world datasets from their own research.

### Evaluation Method

Assignments (40%) and final project (60%)

</tbody>
</table>

### Module Goals

Various forms of microscopy are widely used in biomedical research as well as in clinical medicine. Major classes of microscopy include: A) optical microscopy (wide-field, fluorescence, laser-scanning confocal, Raman, bioluminescence, near-field/scanning-probe, super-resolution, non-linear, light-sheet, intravital), together with a variety of fluorescent and other probes (dyes, fluorescent proteins, small-molecules) and B) electron microscopy, in both transmission and surface-scanning modes.

The goal of this Module is to introduce the basic physical principles of the different forms of microscopy and survey the different techniques, instruments and probes used in studying bio-specimens (cells, tissues, biomaterials), illustrating these with examples of biomedical applications. The role of digital techniques and image processing/analysis will be considered.

### Evaluation Method

Written Assignment

</tr>
<tr>
<td>Recommended Prerequisites</td>
<td>None</td>
</tr>
</tbody>
</table>

#### Module Goals

The use of light in medical diagnostics, therapeutics and biomedical research is increasing, driven by the advent of new light sources, inexpensive imaging detectors, advanced fiber-optic delivery systems, better understanding of light-tissue interactions, and proven research and clinical applications. The course will focus mostly on *in vivo* photonics and initially cover (1) the relevant issues of light propagation in / interaction with turbid media such as tissue. The bulk of the course will focus on (2) particular technical implementations and research / pre-clinical / clinical results in photo-diagnostics (effects of *tissue on light*) and phototherapeutics (effects of *light on tissue*). Advanced topics such as (3) molecular imaging, nanophotonics, optical clearing and theranostics will also be briefly covered. As such, the course goals include basic competencies in these three [(1)-(3)] areas.

For students with limited background in optics and photonics, we will also run a series of tutorials to provide some "light" basics we deem useful for the course. These will be offered prior to the module itself, and will be optional for interested students.

#### Evaluation Method

Class participation (25%), and the oral exit exam (75%)

#### Schedule

# Winter 2022

<table>
<thead>
<tr>
<th>Topic</th>
<th>MBP 1408H - Medical Device Commercialization Essentials</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coordinators</td>
<td>Drs. Graham Wright, Brian Courtney &amp; Ahmed Nasef</td>
</tr>
</tbody>
</table>
| Day & Time | Tuesdays, 5:45 – 7:30 pm (lecture dates subject to change)  
Orientation: January 4, 4:30-5:30PM. |
| Location | SRI, 2075 Bayview Ave. Room TBD |
| Recommended Prerequisites | Medical Device Innovation & Entrepreneurship is a co-requisite (must be taken at the same time) |

## Module Goals
Not all medical device innovations will make it into patient care. Without a compelling, accessible market, a sustainable business model and operating plan, a well-thought-out plan for acquiring and managing intellectual property, and strong regulatory and reimbursement strategies, even the seemingly most important medical innovations are unlikely to be commercialized. The Medical Device Commercialization Essentials course complements the Medical Device Innovation and Entrepreneurship module and provides students with an experiential connection to the process of commercializing novel medical discoveries. The course focuses on systematic examination of issues and factors that directly affect the financial viability and sustainability of a medical device innovation and impact the innovator’s ability to successfully commercialize a solution. The delicate and frequently conflicting interplay between intellectual property, regulatory environment, reimbursement mechanisms, business strategy and financial modelling are explored with hands-on exercises and interactive workshops.  
The module is recommended for students who would like to: (1) catalyze innovation in major medtech companies; (2) build their own medtech start-ups; (3) draw on world-class innovative research conducted in Canadian universities, research institutes and hospitals; and (4) lead translational research projects.

## Evaluation Method
In the Medical Device Innovation & Entrepreneurship module, students present a systematic review of significant clinical challenges and propose the development of novel medical device solutions that address the gaps in these challenges. In this commercialization module, students are required to incorporate the analysis and critical review of the prospective novel medical device concept from assignment 1 into a high-level report or a business case proposal.  
Students are to assume that this high-level proposal will be reviewed by an industrial technology advisor (ITA) through Sunnybrook’s technology transfer office. The ITA will assess the potential of financially supporting the commercialization of this technology and determine whether or not an adequate market opportunity exists to support the development of an innovation. The students should draft the business case proposal within this commercialization context. The business case proposal should include the following sections to demonstrate commercialization potential: technology overview, market opportunity, industry analysis, business model/value proposition, and associated preliminary IP and reimbursement strategies.  
Grading Scheme: Class participation (10%), Group Report (90%).

[Return to Winter 2022 Course List]
### Module Goals

Innovations in Medical technology have led to revolutionary advancements in health care. As new devices and technologies are developed, patients are benefiting from more targeted, less invasive treatments. However, new standard of care technologies won’t reach the bedside unless inventors have the skills to bring them to market.

The Medical Device Innovation and Entrepreneurship course is an opportunity to explore and navigate the principles underlying the challenges of medical device development. The course is designed to engrain the key mindsets and skill sets that help make successful medtech entrepreneurs. The course addresses the fundamental aspects from developing an idea to commercial success, enabling students to gain knowledge of the role of intellectual property management, regulatory pathways, reimbursement mechanisms, funding models, and business strategy in the successful commercialization of new medical device technologies.

The course is delivered using a mix of lectures, guest speakers, team projects, recommended readings and online learning materials. In addition, students get the opportunity to network with local experts and thought leaders in the medtech field. The module is recommended for students who would like to: (1) catalyze innovation in major medtech companies; (2) build their own medtech start-ups; (3) draw on world-class innovative research conducted in Canadian universities, research institutes and hospitals; and (4) lead translational research projects.

### Evaluation Method

Teams of students will have the opportunity to examine and analyze medical technologies that address unmet healthcare needs. Students will be required to explore the clinical problem context, assess the clinical need, motivations and influences of all stakeholders, identify and analyze existing solutions and treatment options, and assess market and commercialization potential with the goal of providing a critical review and strategic assessment of the identified technologies.

Students will be evaluated based on: (i) in-class participation; and (ii) a presentation, which will include the following sections:

- An assessment of the clinical need & underlying problem leading to the new device. Students are expected to perform medical literature reviews through online sources e.g., PubMed, Harrison’s online, etc.
• Market analysis including market size, segments, attractiveness, and competitive dynamics
• Analysis of the different parties and stakeholders involved in delivering and financing care related to the clinical challenge (e.g. patients, physicians, hospitals, government officials/legislators, MOHLTC, nurse practitioners, etc.)
• Analysis of treatment options and innovations available prior to the identified novel device that tried to address the identified clinical challenge. Students are expected to perform a comprehensive review of previous innovations outlining their strengths and weaknesses.
• An overview of the medical device concept that has been developed to address the need including associated regulatory & reimbursement considerations.
• A critical review of possible areas of improvement for the identified device

Students will be evaluated on how well they have taken the lessons taught during the course and applied them. For all evaluations, students are required to demonstrate both that they have the evidence to support their claims as well as that they have added value by extending the analysis and using creativity.

Grading Scheme: Class participation (10%), Group Presentation (90%).

<td>TBD</td>
</tr>
<tr>
<td>Recommended Prerequisites</td>
<td>The suggested textbook for this course is Basic Clinical Radiobiology, Fifth Edition. It is strongly recommended that you read this book before attending the course.</td>
</tr>
</tbody>
</table>

### Module Goals
This program provides a comprehensive overview of radiation biology with a particular emphasis on aspects of direct relevance to the practice of radiation oncology. It addresses the molecular and cellular responses to radiation-induced damage that influence cell death in both tumors and normal tissues. Quantitation of radiation effects and the underlying biological basis for fractionation of radiotherapy and dose-response relationships in the clinic are covered in depth. The biological basis for current approaches to improve radiotherapy will be described including novel fractionation schemes, retreatment issues, targeting hypoxia, biological modifiers and combined radiotherapy/chemotherapy.  
Suggested textbook for this topic is:  
This topic is also offered through the Department of Radiation Oncology to residents in radiation oncology and physics, as well as other radiobiology researchers.

### Evaluation Method
Exam (100% of the grade). Friday, May 6th. Location TBD

<tr>
<td><strong>Day &amp; Time</strong></td>
<td>Mondays &amp; Fridays, 9:30 am – 3 pm</td>
</tr>
<tr>
<td><strong>Location</strong></td>
<td>TBD</td>
</tr>
<tr>
<td><strong>Recommended Prerequisites</strong></td>
<td>A foundation in signals and systems theory and Fourier transforms is required. Students are strongly advised to take the Overview of Medical Imaging module prior to this one.</td>
</tr>
</tbody>
</table>

**Module Goals**

This course covers the fundamental principles of ultrasound for both imaging and therapy applications.

Ultrasound imaging is a high-resolution and rapid imaging modality with many clinical applications, from monitoring fetus in pregnancy, to diagnostic imaging of breast, abdomen and vasculature, and guiding interventional tools in minimally-invasive procedures. Ultrasound therapy is a targeted method of delivering energy into tissue for treatment of disease or for drug delivery, with a broad range of clinical applications.

This course will introduce the principles of ultrasound imaging, starting with a general overview of this imaging modality and its applications. It will cover the basic physics of ultrasound, interaction of ultrasound waves with tissue, transducers and arrays, image formation, signal processing, flow detection, ultrasound contrast agents, and example implementations of ultrasound.

The lectures will be given over four days with two practical laboratory sessions to reinforce the taught concepts.

**Evaluation Method**

Lab report (50%) and exam (50%)
